

Dear Fieldguide hiring team,

Your agentic-first financial auditing is the kind of challenge I love. Your Field Financials agents and the Fieldguide MCP connector are solving a problem I solved at smaller scale: letting AI agents touch prod while keeping a hard autonomy and auditability boundaries - the same challenged described in your Staff role.

As Lead Data Engineer at Pharmacists Mutual, I authored the security framework that cleared agentic coding use: least-privilege SQL logins, managed settings, and a custom SQL MCP server, specially-scoped depending on the environment (DEV/UAT/PRD). That work cut Agile story delivery time roughly in half. I also set technical direction for our migration from on-prem SQL Server to Azure and Microsoft Fabric, and rebuilt our reporting platform from scratch after a vendor (iPartners) shutdown, cutting storage 50% and processing time over 60%.

Outside work I build full-stack systems solo: a Node/Express and React writing tool with JWT auth and recursive tree services, a FastAPI backend with rate limiting, and a Dagster pipeline running unattended on a five-dollar VPS. I like owning every piece of a system: design, architecture, infrastructure, implementation, validation, delivery.

I've hired and onboarded engineers, and converted single-owner systems into documented, team-owned services - I'd welcome the chance to bring some of this experience to the Fieldguide team.

All the best,
Sander VanWilligen
