

Dear Pomelo Care hiring team,

Pomelo's "first month after enrollment" challenge is the kind of one I love spending my time on. I've spent ten years building the systems that make a product trustworthy; I want to bring that discipline to a team that treats patient engagement as core engineering.

At Pharmacists Mutual I lead a small engineering team: architecture decisions, code standards, hiring, onboarding, mentoring - the works. I championed agentic coding tool adoption org-wide, running the evaluation and writing the security framework (guardrails, approval flows, a custom SQL MCP server). The work I did cleared Claude Code for prod and cut our agile story delivery time in half. I mentor engineers directly and stay close to LLM coding agents.

Outside work I build and ship solo. Leaves is a full-stack writing tool: a React 19 front end with drag-and-drop tree building, a Node/Express API behind JWT auth and httpOnly cookies, tested with Vitest and Supertest. Dying Skies pairs a React front end with a FastAPI backend handling session auth and rate limiting, on infrastructure I provisioned and wired to CI. Both taught me to move fast while keeping the data and auth underneath solid.

I don't have direct healthcare experience, but I bring what this role asks for: technical ownership across the stack, fast iteration alongside design and product, and mentoring engineers to raise the team's bar. I'd welcome the chance to talk through how I can fit in at Pomelo.

All the best,
Sander VanWilligen
