

Dear eClinical Solutions hiring team,

Your Principal AI Engineer role describes my present, existing workflow. I'm already hands-on with agentic tooling, shipping in prod, and building the guardrails for my current company. I ran that evaluation for Claude Code at Pharmacists Mutual, wrote the security framework, and watched it cut our Agile story delivery time roughly in half. I'd bring that same builder-first approach to your own company.

I'm a full-stack engineer with ten years of experience across Python, TypeScript, SQL, React, .NET, etc - currently leading a data engineering team where I set architecture, hire, mentor, and own outcomes. I rebuilt an enterprise reporting platform from scratch, cutting storage 50% and processing time over 60%. I'm now defining company direction for a migration to Azure and Microsoft Fabric.

I also have experience with the role constraints you listed in the posting. I built the MCP server and access controls for our AI rollout inside a financial-services company with state/federal regulations. I understand what it takes to ship agentic systems with proper data handling and validation.

eClinical's push toward agentic clinical data automation is the kind of work I like doing, and the kind I already have experience with. I'd welcome the chance to talk through how I could contribute to your team.

All the best,
Sander VanWilligen
