

Dear Engine hiring team,

Your position mentioned a few different challenges an applicant would face: versioning, deprecation, rate limiting for partners like Navan, at scale. Those are the sorts of challenges I've spent ten years solving. I built a Node/Express REST API with JWT auth and rate limiting, and a FastAPI backend with its own auth and rate limiting layer, and I've led three separate upgrades to my current company's enterprise analytics platform across the years.

I'm also AI-first by daily practice. I championed agentic coding tool adoption at Pharmacists Mutual, ran the evaluation, and wrote the security framework. This work covered least-privilege SQL logins, managed settings, and MCP servers across DEV/UAT/PRD. The sum of these combined cleared Claude Code for prod, and the resulting integration with both our software and data teams (both of which I trained) cut our Agile story delivery time roughly in half.

I currently lead Pharmacists Mutual's data engineering team: architecture decisions, code standards, hiring, mentoring, onboarding, daily one-on-ones. Since I took on the role of lead, we've continuously converted our previously-undocumented, single-owner systems into team-owned services.

Your job post mentioned rebuilding infrastructure from the ground up, with AI embedded throughout. I'd welcome the chance to talk about how I can contribute to Engine's efforts in that area, given my existing background described above.

All the best,
Sander VanWilligen
