

Dear ezCater Hiring Team,

I'm applying for your Senior Software Engineer role because I have the interest in, and the skillset for, the challenge your post describes: reliable backend for heavy transactional processing, built in today's age of Agentic SDLC.

I have ten years shipping production systems, and currently lead, mentor, and train a small engineering team. I built a security framework that cleared agentic coding tools for production (this is in heavily-regulated insurance). Least-privilege database logins, managed settings, approvals, a custom SQL MCP server scoped across DEV, UAT, and PROD. I conducted the training sessions on these tools for both the software and data engineering teams. Overall, that work cut Agile story delivery time by roughly 60 percent.

On the engineering side, my projects mirror the exact requirements your job posting listed. Dying Skies pairs a FastAPI+Postgres backend with argon2id auth and rate limiting. Leaves is a layered Node and TypeScript service over a recursive tree data model. Gutenberg-Fingerprint is a nightly CDC pipeline, running against DuckDB locally and Postgres again in production. I care about schema design, migrations, service boundaries, telemetry, safe rollout, clean and understandable code, etc. - in my leisure and my work. I'm no "fairweather designer."

My deepest backend production experience is in Java, C#, and SQL rather than Go. BUT, I pick up languages quickly, and I absolutely adore Learning. It's the reason for being alive, IMO. If you'll have me, I'd bring high ownership, strong communication, a solid track record of challenge-solving, and well-tested deliveries.

All the best,
Sander VanWilligen
