

Dear Skylight Data Team,

I'm applying for your Senior Analytics Engineer role because it lines up almost exactly with the work I've spent the last several years doing, just for a company I'd much rather work with.

For the past decade at Pharmacists Mutual I've owned the finance-and-operations data layer end to end. I rebuilt our analytical reporting from scratch, replacing broken logic from a dead vendor with documented models. This rebuild cut processing time over 60% and storage 50%. Since then I've been the main point of contact on analytics for C-suite leadership. Now as the Lead Data Engineer, I own our migration to a medallion lakehouse, and on the personal side, I increasingly work in dbt, Dagster, Postgres/DuckDB, and Python.

The parts of this posting I'm most interested by are metric governance and data quality. I've integrated a master data management platform into our pipeline and built the validation and reconciliation systems. I'm comfortable both giving and receiving constructive feedback on metric definitions, and comfortable working where pipelines and definitions are still forming. Your Snowflake and Omni stack is newer to me than SQL Server / Postgres, but the modeling discipline transfers. Plus I'm a quick study; I taught myself modern data stacks building a nightly stylometrics pipeline on dbt and Dagster in my spare time.

I'd welcome the chance to talk.

All the best,
Sander VanWilligen
