

Dear Points Guy Team,

The line in your posting that made me apply was "zero management responsibility, by design." I lead a team today, and I care a lot about the people on it, but the company I currently work for wants to move me into a 'management, hands-off' role. For me, that's torture. I love having my hands in the tech, the same way a sculptor loves having hers in clay. A role that keeps me in the code, raising the bar through pairing and the example I set, is exactly where I want to be.

I have spent ten years shipping production systems in TypeScript, Python, and SQL. I build full-stack: React 19, node, Canvas render loops, drag-and-drop editors, Express and FastAPI services, hand-rolled auth, session and rate-limit layers behind them, Terraform, containers, both the CI and the CD. I ship these solo and end to end.

Your bet on AI-native development is another piece I'm eager to work on. I championed agentic coding tools across my current org (insurance - one of the industries most-resistant to change). I ran the evaluation and authored the security framework - least-privilege logins, approval flows, a custom MCP server - that cleared Claude Code for production. Then I trained the other engineers in its use. Story delivery time dropped about 60%. I cannot remember the last day I spent where I didn't have an agent doing something - they're like water to me now, or oxygen. I know where they're useful, where they lie, and how to show other engineers the difference, so that they can get as much leverage as I do.

The transformation from content to products that act on a user's behalf is a hard, awesome challenge. I would love to build it with your team.

All the best,
Sander VanWilligen
