

Dear Mattermost hiring team,

Security-minded full stack work is my bread and butter: thus, I'm applying for the Senior Full Stack Engineer role. Your post puts AI and security side by side, and I spend most of my days there (because it's what I like doing).

I've shipped prod systems for the last ten years. The closest match to your stack is my recent side work.

- Dying Skies is a React and TypeScript front end on a FastAPI and Postgres backend. Also auth: argon2id, httponly session cookies, rate limiting.
- Leaves is Node, Express, and React, with Zod validation on requests, rotated refresh tokens, and Vitest/Supertest/React-Testing-Library suites. Go is my weakness - I've haven't had a use-case for it yet.
- My backends are Node and Python, so I'd be learning it on the job. Your post says you hire for output over a stack match, and I've picked up new stacks before, often, and gladly.

AI is where I'm strongest. At Pharmacists Mutual I'm Lead Data Engineer, and I pushed Claude Code adoption across both the software and data engineering teams. I ran the evaluation, then wrote the security framework that cleared it for prod: guardrails, approval flows, a custom SQL MCP server. Agile story delivery time dropped by about half. I also keep a library of custom Claude skills, so your MCP server and agent skills nice-to-haves are covered.

I work well without much supervision. I was the sole technical decision-maker on a reporting platform rebuild that cut storage 50% and processing time over 60%, and I reported straight to C-suite. Reach out (in whatever way you please) if you think I might be a good fit (or even just an "okay" one) for the role.

All the best,
Sander VanWilligen
