

Dear Rocket Money hiring team,

Billing that can't drop a transaction. Subscriptions that can't quietly break. That's the infrastructure your post describes, and it's where I want to spend my time. I like it when the stakes are real money, moving every day - it's where I've built my experience, my engineering specialty.

I've spent ten years building systems like the ones described in your job posting. My first real payment work was a .NET service I built early on, integrating Paymentus for automated payments and paperless billing. I also built a nightly OFAC compliance process (Java Spring Boot), so handling sensitive financial/customer data isn't new to me. Since then I've spent my time in backend/databases, or building my own project full-stack: Node/Express and FastAPI services, Postgres/Mongo/DuckDB/SQL Server schemas, React/Astro front ends, the auth and session layers underneath them, the works.

I've also become the person who pushes AI tooling into prod (safely!). I evaluated Claude Code for my current team and wrote the security framework (guardrails, approval flows, plus a custom SQL MCP server) that got it cleared for use by both our software and data engineering teams. Since then, our agile story delivery time has dropped by 50%. Your post says you want people using the best tools, AI included, without cutting corners on diligence. That's been my actual job for the last two years.

Nowadays I lead the data engineering team at my current company: architecture calls, hiring, mentoring, onboarding. These past three months, I also took a couple of undocumented, one-person-owned state/federal reporting systems, and turned them into ones the whole team understands and owns.

If any of this sounds like an engineer your team could use at Rocket Money, I'd welcome a chance to chat.

All the best,
Sander VanWilligen
