

Dear EquipmentShare Team,

I'm writing to apply for the Analytics Engineer role at EquipmentShare. As a Lead Data Engineer with 10 years building and owning enterprise data, I was drawn to the chance to bring that same hands-on ownership to a company using some of my favorite tech to modernize an industry.

Over the past several years I've built and rebuilt ETL pipelines from the ground up using SQL, Python, and dbt, replacing legacy vendor logic with documented. In the main Pharmacists Mutual analytics platform, I cut processing time over 60% and storage by half. I currently lead a migration from on-prem SQL Server to a lakehouse on Azure/Microsoft Fabric, and I integrated a master data management platform into our core pipeline, redesigning ingestion to route through MDM rather than straight from source. I'm comfortable owning all parts of the data: business requirements, specific dbt transformations, stakeholder dashboards - whatever gets us to the goal.

Beyond the technical work, I've spent the last several years translating between the business and the tech, including reporting to our C-suite as the primary architect. I've also led hiring and onboarding for my team, so I know what it takes to ramp up quickly and work independently in a fast-moving environment (which sounded like a core part of the job post).

I'm particularly excited about the scale of data EquipmentShare's platform generates, and challenges of that scale generally. "...reducing complexity in accessing and querying cross-functional data," - the quoted requirements of your posting - is exactly the kind of work I've spent my career on. I'd welcome the chance to bring that experience to a team building something genuinely new in construction. If this sounds like a fit, let's talk.

Thank you for your time and consideration.

Sincerely,
Sander VanWilligen
