

Dear Jellyfish Hiring Team,

I'm applying for the Full Stack Engineer role because I already adore the AI adoption Jellyfish measures. I championed agentic code adoption across my current company, running the training for 13 other engineers in both the software and data teams, and watched Agile story delivery time drop by roughly 60%. I would rather help build the tool *showing* AI's impact than speak in anecdotes.

On the stack, I ship the whole path in TypeScript and Python. My projects run React 19 front ends, Node/Express 5 and FastAPI services, hand-rolled auth, session and rate-limit layers, Postgres and Mongo storage, Terraform, containers, GitHub Actions CI/CD - the whole darn stack. Django isn't my primary framework, but the patterns mentioned in the job post (REST contracts, ORM-backed models, fast, safe deploys to a SaaS environment) are my oeuvre. I pick up new tools quickly, not because I must (not in insurance), but because I may.

That second part matters to me. To engage in a little melodrama - learning new things is, as far as I'm concerned, the whole reason for being a living Human Being. It's what separates me from a cow chewing grass. I read documentation for fun - or make AI read it and summarize. I use what I read to build side projects to try new ideas. I love exploring the line between what AI can and can't do for me. A growth-stage startup is the environment I've been trying to get into. Insurance is slow on change, and next to the rise of LLMs, it looks even slower. I'm eager for a place that moves fast and rewards curiosity.

I currently lead a small engineering team, so I know how to communicate, provide status updates, build consensus, own production support - the softer skills, sans drama. I'd bring all of that - and enthusiasm to boot - to Jellyfish's challenges. I'd love to talk.

All the best,
Sander VanWilligen
