

Dear SundaySky Team,

I build software that makes media - according to the job post, that's SundaySky's whole hallmark. Your platform turns data into personalized video rendering - on dyingskies.com I built and run a custom render loop with: devicePixelRatio-aware backing store, hit-testing on rotated sprites, and seeded generative music through Tone.js. Real-time rendering, motion graphics, and asset handling are how I already spend my weekends.

The role mentions full-stack, hands-on experience. Across projects I ship React/TypeScript front ends; Node/Express and FastAPI backends with hand-rolled auth, session, and rate-limiting; Postgres and MongoDB schemas; and the Terraform, containers, Github Actions, and cloudflare hosting which takes the stack and plops it into a webpage. At Pharmacists Mutual Insurance Group I rebuilt an enterprise reporting platform from scratch, cut processing time over 60 percent, and now lead the team's architecture, hiring, standards, mid-level mentoring, and Agentic Training for both the software and data engineering teams. I brought agentic AI tooling to my company, authoring the security framework and a custom MCP server that cleared it for prod.

So why am I leaving? Because there's nothing left to learn! A little exaggeration, but the slow, risk-averse pace of a small insurer cannot maintain a steady learning pace for me in the age of Agents/LLMs, not like a growing, 80-person startup company. Yours is the product and environment I'd dearly like to work in, and one I'm geared for. If you think I'm a fit, for this or another position, reach out.

Best,
Sander VanWilligen
