

Dear OnePay hiring team,

Instapay, savings, and budgeting tied to pay schedules. Money product, so every transaction has to land. That's the kind of pressure I'm good at working under: that's why I'm applying for the role on the @Work team.

I have ten years experience in the field, full stack since I started, and these days I lead the data engineering team. I set the architecture and code standards. I also do the hiring, training, one-on-ones, and the onboarding. I rebuilt an enterprise reporting platform from scratch, ditched the opaque vendor logic for documented, tested code - the result cut storage 50% and processing time by over 60%. Early on I wrote a Java service that plugged into Paymentus for automated payments and paperless billing, plus a nightly OFAC screening job. Regulated money movement is nothing new to me.

My side projects are TypeScript end to end. Leaves (<https://github.com/sandervw/LeavesApp>) is a Node/Express 5 API with Zod validation, rotated JWT refresh tokens and rate limiting, with a React front end and Vitest and Supertest tests. Dying Skies (<https://github.com/sandervw/dying-skies>) is React and Canvas up front, FastAPI and Postgres behind it, with argon2id auth and CI/CD. I haven't shipped NestJS or React Native yet. Node, TypeScript, and React carry over, however, and I love learning new technologies more than just about anything (learning is the meaning of living, IMO).

I also pushed agentic coding through my current org. I ran the evaluation and wrote the security framework that cleared it for prod. Working with Claude Code every day sounds great to me, since I do it already, every day, nonstop. I'd love the chance to talk about your @Work roadmap, and how I might fit into the role.

All the best,
Sander VanWilligen
